

Metrology and Dosimetry of At-211 Radiolabeled Compounds

Gamal Akabani, Ph.D.

TRT Dosimetry Workshop

April 19-20, 2018

Outline

- Physical and radiobiological characteristics of At-211
- Production methods and sites
- In Vitro Studies
- Preclinical Studies
- Clinical Trials
- Conclusions

Physical Characteristics of At-211

- Astatine was produced for the first time at the University of California in 1940 by Dale R. Corson, K.R. Mackenzie, and Emilio Segré.
- Half-life: 7.214 h
- Classical production:
 - $^{209}\text{Bi}(\alpha,2n)^{211}\text{At}$ - 28 MeV using a mid energy cyclotron
 - $^{211}\text{Rn}/^{211}\text{At}$ generator system - TRIUMF's Isotope Separator and Accelerator (ISAC) facility – Very complex procedure
- There was no suitable surrogate for molecular imaging until At-209 was produced at TRIUMF

Physical Characteristics of Several Radioisotopes Used for Targeted Radionuclide Therapy

Isotope	Half-life (h)	Particle Emitted for Therapy	Maximum Energy (keV)	Maximum Range in Tissue (mm)
Iodine-131 (^{131}I)	193	β	970	2.0
Rhenium-186 (^{186}Re)	91	β	1,080	11.0
Rhenium-188 (^{188}Re)	17	β	2,120	11.0
Yttrium-90 (^{90}Y)	64	β	2,280	1.2
Lutetium-177 (^{177}Lu)	161	β	496	1.5
Copper-67 (^{67}Cu)	62	β	577	1.8
Bismuth-213 (^{213}Bi)	0.76	α	8,376	0.08
Bismuth-212 (^{212}Bi)	1	α	8,780	0.09
Actinium-225 (^{225}Ac)	240	α	>6,000	0.08
Astatine-211 (^{211}At)	7.2	α	7,450	0.07
Radium-223 (^{223}Ra)	274.32	$\alpha+$	>5,000	0.08
Thorium-227 (^{227}Th)	448.32	$\alpha+$	>6,000	0.08

The half-life of the selected radionuclide must correspond with the biological half-life of the monoclonal antibody for maximum delivery

The Decay Scheme of At-211

At-211

Alpha Particle Energy (MeV)	Intensity (%)	Range in Tissue (μm)	# of Cell Diameters
5.87	41.94	47.98	3.2
6.57	0.337	57.26	3.8
6.89	0.325	61.78	4.1
7.45	57.4	69.92	4.7

Only two or three alpha particle hits to the nucleus are required to sterilize a tumor cell

Production centers

- Europe : 21 centers
- Americas: 8 centers
- Asia: 7 centers

M. R. Zalutsky and M. Pruszynski, "Astatine-211: production and availability.," *Current radiopharmaceuticals*, vol. 4, no. 3, pp. 177–185, Jul. 2011.

Micrometastases: Early Dissemination

- Although primary tumors are diagnosed at a still earlier stage, many patients will have circulating tumor cells and sub-clinical micro-metastases in other organs at the time when the primary tumor is surgically removed.

Braun S, Vogl FD, Naume B et al (2005) A pooled analysis of bone marrow micrometastasis in breast cancer. *N Engl J Med* 353:793–802.

Alix-Panabières C, Müller V, Pantel K. (2007) Current status in human breast cancer micrometastasis. *Curr Opin Oncol*. 19:558-63.

Therapeutic Strategies

- Must Take into account the ***spatiotemporal pathophysiology*** of
 - Tumor growth, Invasion, Migration, Circulating Tumor Cells, and Micro-metastases based on tumor cell heterogeneity and micro-environmental conditions.
- Develop potential combinatorial strategies
 - Anti-tumoral
 - Anti-invasive
 - Anti-angiogenic
 - Anti-vascular
 - **Anti-metastatic, eradication of circulating tumor cells (CTC) and circulating cancer stem cells (CSC) and micro-metastatic disease**
- Different 'targets' require careful selection of a biological (mAb) and radionuclide

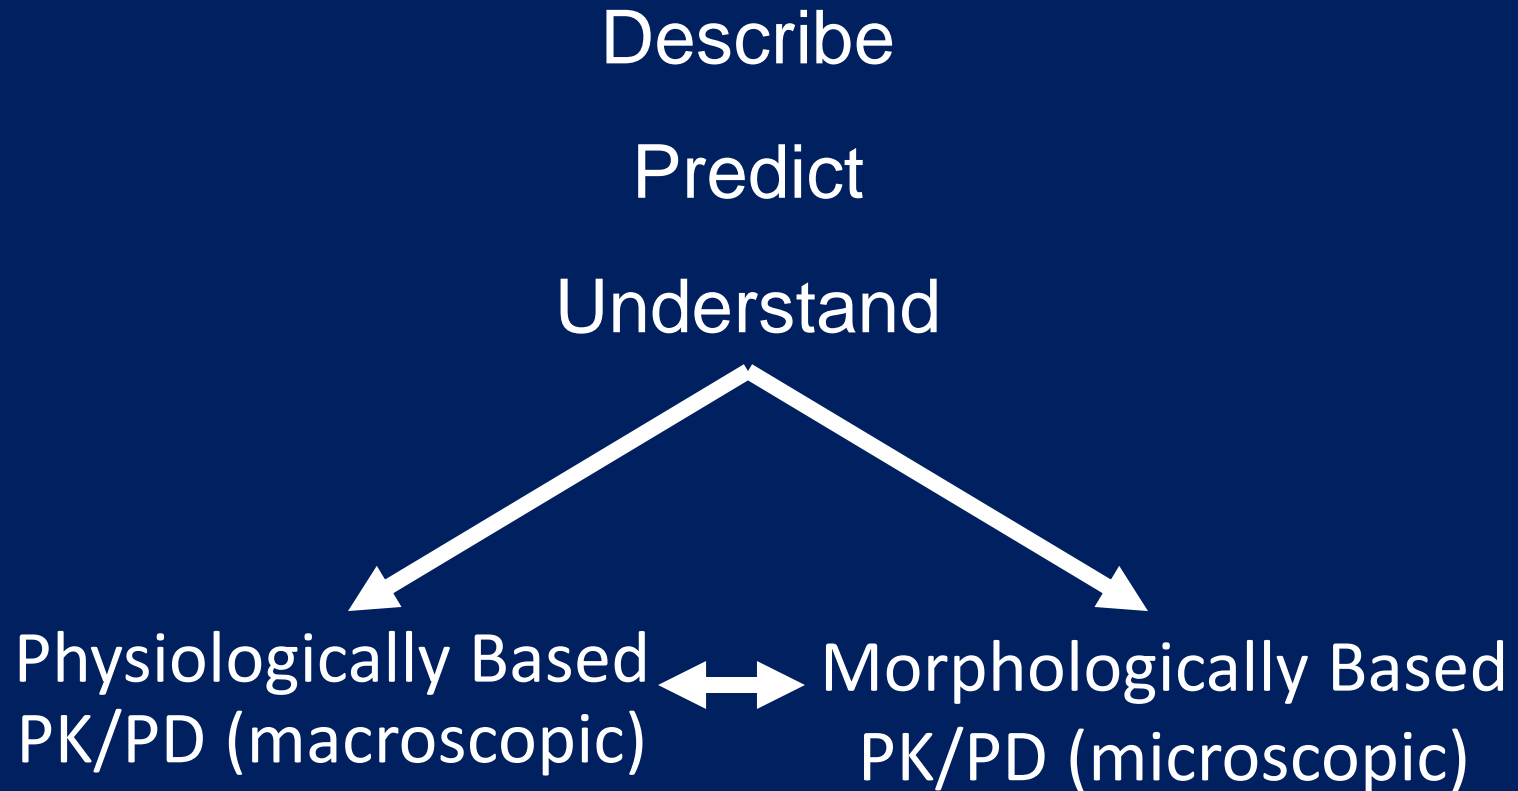

In Vitro Studies

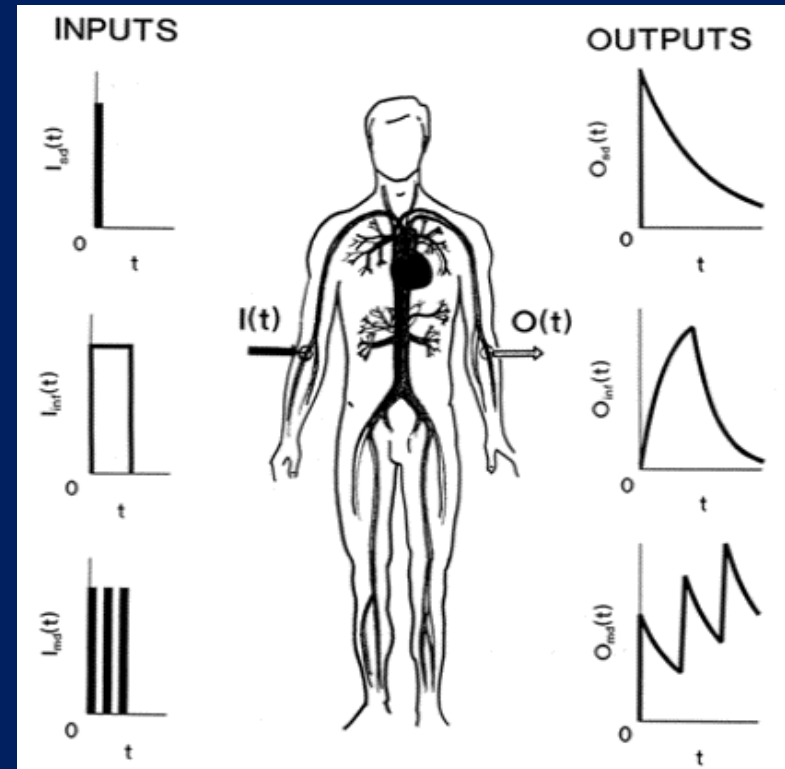

Key Factors in TRT

- Pharmacokinetics and Pharmacodynamics (PB and MB PK/PD)
 - Organ distribution, morphological distribution, diffusion, association rate, k_a , dissociation rate, k_d , internalization rate, k_e , expulsion rate, k_x
- Tumor morphology, spatiotemporal pathophysiology, and micro-environmental factors
- Radiochemistry:
 - Selection, chemistry, labeling, and *in vivo* stability
 - **Radiative emissions (α , β) and range in tissue**

The role of MB PK/PD in TRT

PB PK/PD Models

Limitations and Obstacles on Diffusion of Radiolabeled Compounds

Morphologically Based PK/PD

- Competitive processes between labeled (hot) and unlabeled (cold) monoclonal antibodies

Labeled (hot)

Unlabeled (cold)

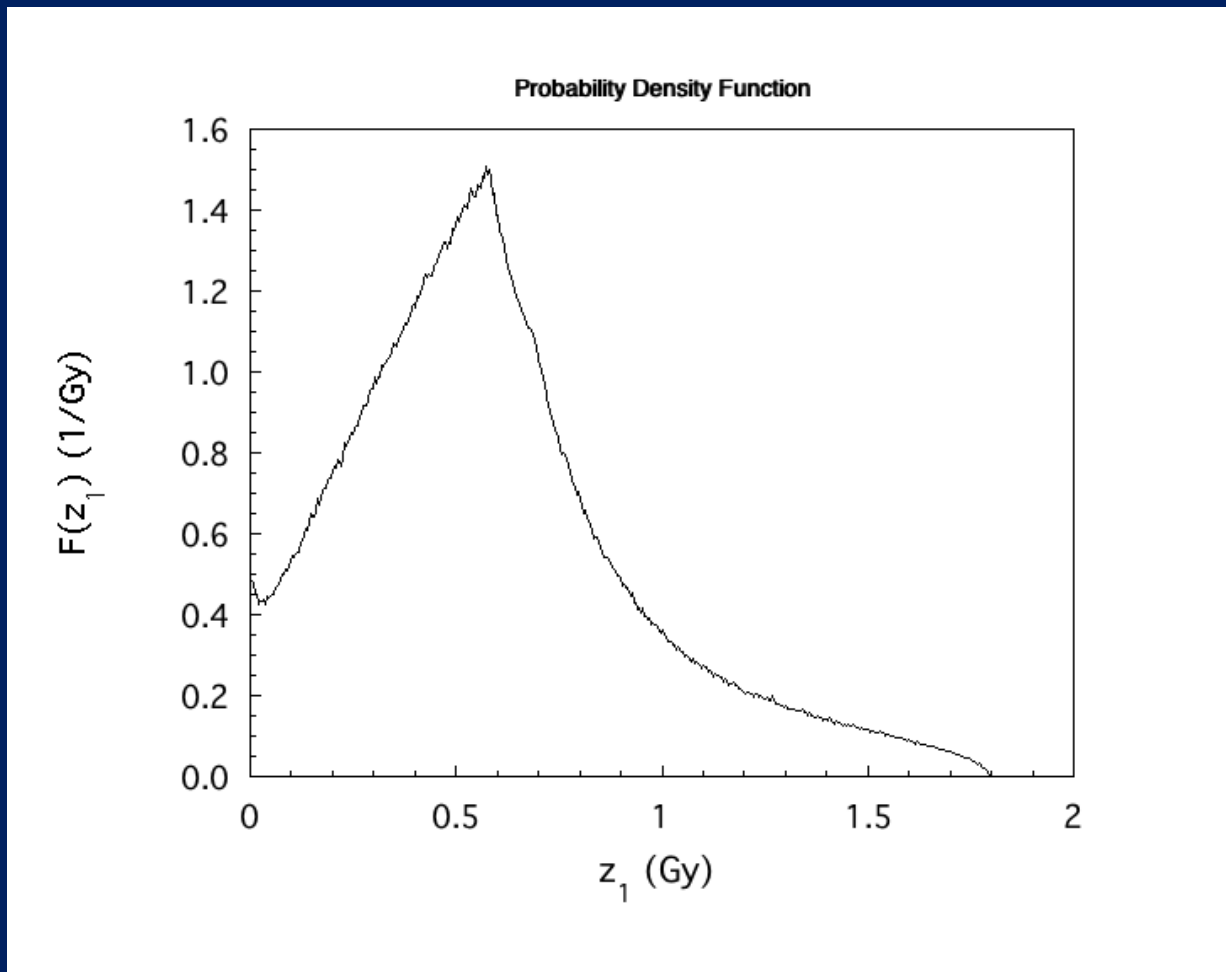

- Morphological barriers, micro-distribution
- Sources of radiation
 - Medium (Extra-cellular space)
 - Cell Surface
 - Internalized

Survival vs Administered Activity SKBr-3

Survival vs Administered Activity MCF-7/HER2-18

Pharmacokinetic/Microdosimetry Modules

Pharmacokinetic model

Cells are divided into 256 cell groups ($j = 1, \dots, 256$) based on FACS analysis on receptor expression

Initial receptor concentration

$$A_{g0}^j = 1 \times 10^3 \frac{d_c f_j N_{Ag}^j}{N_A}$$

Receptor concentration

$$\frac{dA_{g,j}}{dt} = - \frac{dm_{b,j}}{dt}$$

Labeling fraction

$$I_f = 1 \times 10^6 \frac{SA M_W}{\lambda N_A}$$

Estimate the following parameters

- The association, dissociation, and internalization rate constant,
- The specific activity, SA ($\text{kBq } \mu\text{g}^{-1}$)
- The average number of HER-2 receptors per cell,

k_a, k_d, k_e
per

B_{\max}

Pharmacokinetic model

Total mAb

Unbound mAb

$$\frac{dm_u}{dt} = f_u(k_a, k_d, A_{g,j}, m_u, m_b)$$

Bound mAb

$$\frac{dm_{b,j}}{dt} = f_{b,j}(k_a, k_d, A_{g,j}, m_u, m_{b,j})$$

Internalized mAb

$$\frac{dm_{i,j}}{dt} = f_{i,j}(k_e, k_x, m_{b,j}, m_{i,j})$$

Labeled mAb

Unbound Labeled mAb

$$\frac{dm'_u}{dt} = I_f \left(\frac{dm_u}{dt} - \lambda m_u \right) e^{-\lambda t}$$

Bound Labeled mAb

$$\frac{dm'_{b,j}}{dt} = I_f \left(\frac{dm_{b,j}}{dt} - \lambda m_{b,j} \right) e^{-\lambda t}$$

Internalized Labeled mAb

$$\frac{dm'_{i,j}}{dt} = I_f \left(\frac{dm_{i,j}}{dt} - \lambda m_{i,j} \right) e^{-\lambda t}$$

Microdosimetry Module: Converting Hits into Absorbed Dose

Cell morphology

- Medium or Extra-cellular Space
- Cell Surface
- Internalized

Microdosimetry Module: Monte Carlo Transport

Specific energy per event

$$z_i = \frac{\varepsilon_i}{m_n}$$

Average specific energy per event

$$\bar{z} = \frac{1}{N} \sum_{i=1}^N z_i$$

Average absorbed dose

$$D = \sum_{i=1}^n z_i = [h\bar{z}]_{med} + [h\bar{z}]_{CS} + [h\bar{z}]_{Int}$$

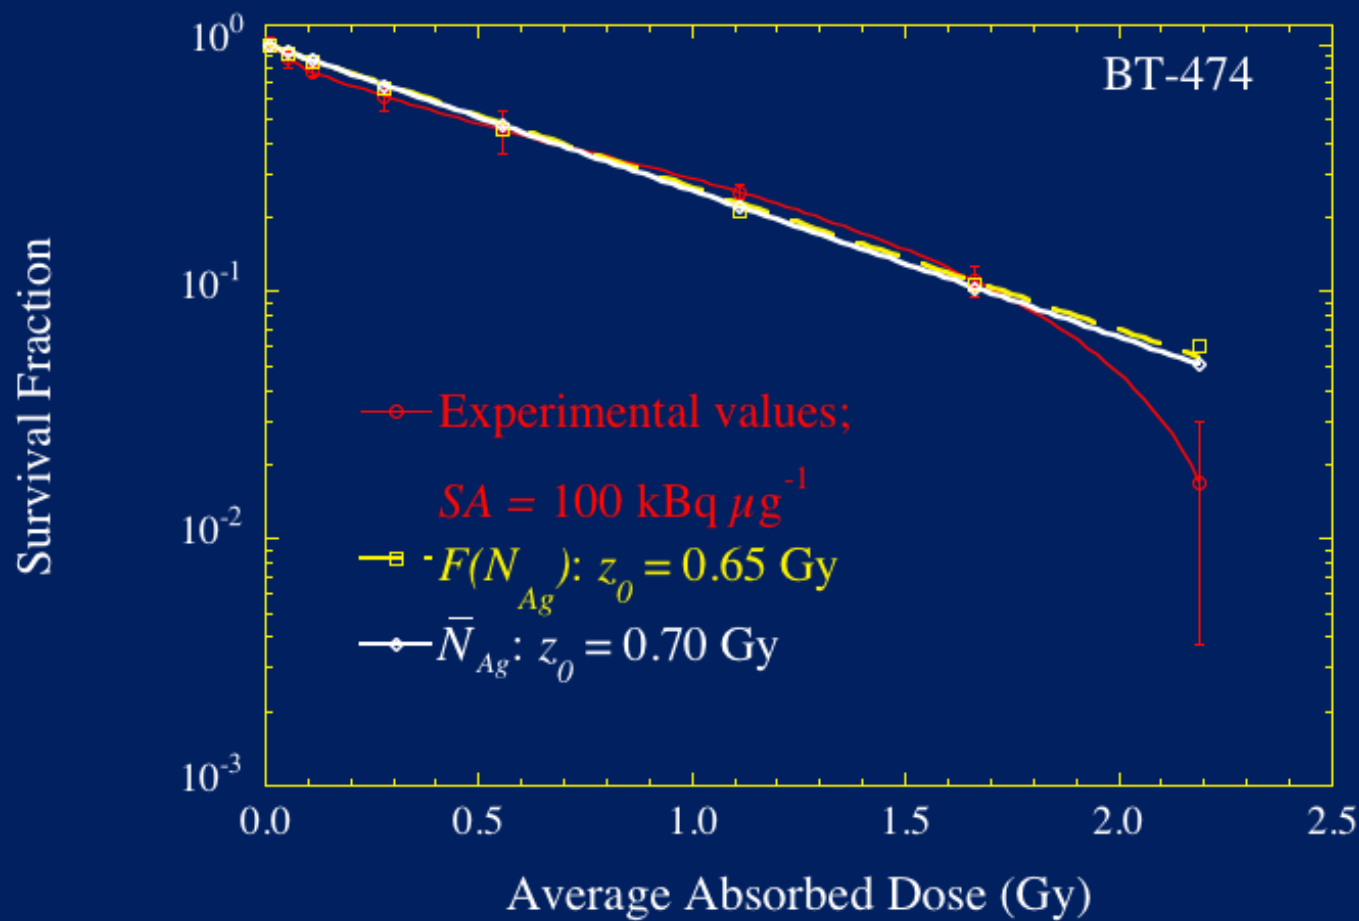

Survival Probability

$$SF = \exp(-D / z_0)$$

Survival vs Absorbed Dose

Survival vs Absorbed Dose

Survival vs Absorbed Dose

Alpha particle-RIT vs XRT

Cell Line	D_{37} (Gy) XRT	D_{37} (Gy) α -RIT	RBE	$\langle h \rangle$ hits
SKBr-3	2.5	0.26	9.6	4.3
MCF-7/HER2-18	3.1	0.36	8.6	5.6
BT-474	6.1	0.63	9.7	9.4

RBE: Relative Biological Effectiveness

Benefits: localized and specific to HER2-positive tumor cells

In Vivo Preclinical Studies

Organ Biodistribution Studies

- Most preclinical studies carry out organ ex vivo biodistribution studies at different time points and assess gross %ID/g, including tumor.
- Tumor and tissue activity distributions are now estimated using in vivo and ex vivo quantitative imaging methods.
- There is a need to establish high fidelity animal model of human cancers
 - PDX models

Ex Vivo Alpha Particle imaging using histological samples

- Alpha Camera - Sweden
- iQID Camera - PNNL/ University of Arizona
- Timepix Detector - Australia
- Small scale dosimetry
 - Staking of histological slides for dose convolution methods
 - Need for superposition with immunohistochemistry tissues
- Tissue sectioning has disadvantages when investigating dynamic processes

Ex Vivo small-scale dosimetry

Ex Vivo Activity Quantification in Micrometastases at the Cellular Scale Using the α -Camera Technique

FIGURE 2. Description of sectioning scheme performed on biologic samples. (A) Method for all biologic samples: first section was used for α -camera imaging and consecutive section for H&E staining. In some cases, 3 consecutive sections were taken (B) to evaluate accuracy of cell number determination.

In Situ Dosimetry

Estimated absorbed doses were about 40 and 12 Gy for large (23 – 43 μm) and small (<13 μm) tumor foci

In Vivo Imaging

- There are limitations in using the alpha camera in carrying out single-animal longitudinal studies.
- There is the need for long-term longitudinal studies where each animal is its own control.
- Better estimations of the residence time in organs at risk, blood and bone marrow and other regions including tumor.

$$P(x \cap d; t) = \frac{e^{-\mu x}}{d!(x-d)!} (1 - e^{-\lambda t})^d (e^{-\lambda t})^{x-d}$$

Binary radioactive NPs

- We desire the combination of a PET or SPECT imaging radionuclide and an alpha particle or Auger emitting radionuclide.

Examples

- Alpha/PET-AuNPs
- Auger/PET-AuNPs
- Beta/PET-AuNPs

Conclusions

Conclusions

- Dosimetry is a continuum
 - From In vitro studies and models
 - To high fidelity animal models of human cancer
 - To clinical trials
- Dosimetry of alpha particle radiotherapeutics needs to consider and incorporate the spatiotemporal pathophysiology and morphology of the tumor tissues at the same scale of the range of alpha particles in tissues to assess its benefits and limitations
